

The superior steel rainwater system .....

- complete, flexible, and do it yourself (DIY) installation
- made from durable hot dipped galvanized steel
- maximum protection against corrosion
- colour coated with thick polyester coating
- extreme durability in all kinds of weather
- half round design for most efficient draining
- steel construction for strength holding shape over time
- environmentally superior, and a low carbon foot print

Lindab Rainline™

## Lindab Roof Drainage System

A solution that is as right as rain

..... in popular, vibrant colours

# Solutions that enhance the overall project

**Stop ends**  
 These ends are self-sealing with an EPDM seal, and fit on either end of the gutter. Quickly mounted with a single, firm knock.

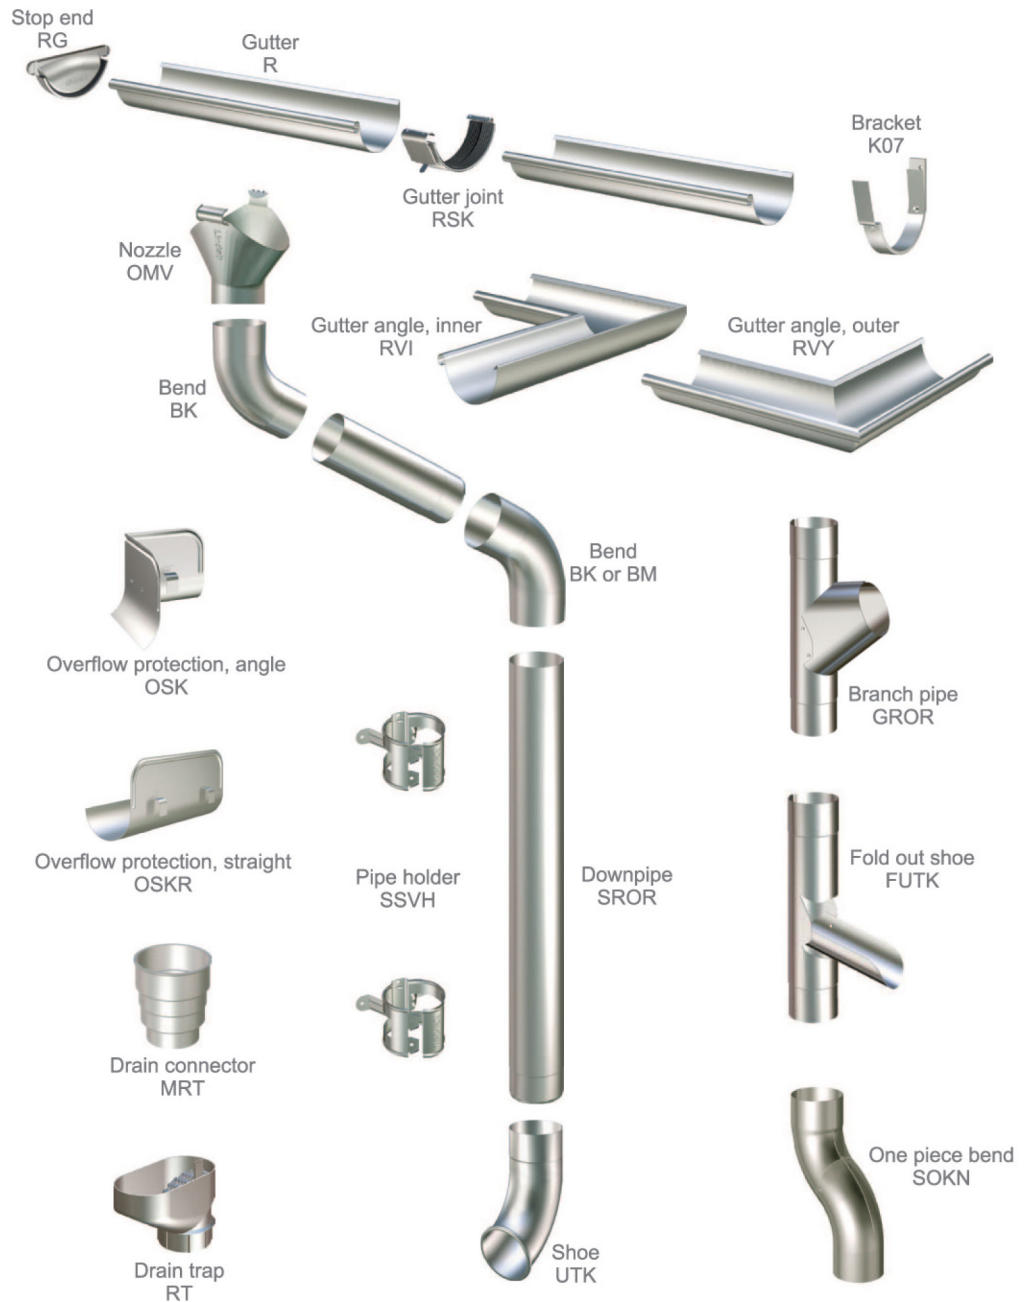

**Pipe holder**  
 This holder is made from one piece of sheet steel, and installs around a pipe by snapping the ends together.

**Gutter joint**  
 These joints are easy to fit, creating firm durable joints. Guaranteed to be leak-proof due to the EPDM seal.

**Nozzle / Outlet**  
 Outlet has a one-grip, snap-on mounting that ensures a perfect fit to the half round gutter. Mountable after the gutter is in place.

Lindab Rainline is the roof drainage system that offers the highest quality when combining proven durability, flexibility, and ease of installation.

#### Superior snap-in fitting

Each Rainline component has been designed and manufactured to the highest standards and smallest tolerances. The result is a system where every part snaps into the next to give a perfect leak-free fit.

#### Strong as steel

Steel is tough, versatile and durable. Lindab buys more than 200K tonnes of sheet steel annually. Lindab's extensive steel processing experience ensures a quality, engineered product. Steel is the ultimate material for roof drainage systems.

#### Galvanized steel sheeting

To provide durable rust proofing the steel is coated with 275g of zinc per sq. metre. The galvanized coating is naturally self-healing. Scratches or cuts to the finish are automatically sealed by zinc ions, which search out and re-coat the uncovered steel.
